

Final Proposal

(Leyendas de mi Tierra)

Concept and Experience

Leyendas de mi Tierra is a 2D Action-RPG I'm building in JavaScript that puts a spotlight on Colombian folklore and geography. You play as a traveler moving through five distinct zones: the **Andean Highlands**, the **Caribbean Coast**, the **Pacific Mangroves**, the **Amazon**, and the **Eastern Llanos**.

The main focus is on exploration and fast-paced combat. As you move from one region to the next, the environment changes, and the difficulty spikes. I'm designing the "bosses" around iconic Colombian myths like **El Sombreroón**, **La Tunda**, and **Madremonte**. The goal is to survive these encounters and collect cultural artifacts hidden across the map. I want the player to feel the tension of a horror-themed encounter, but with the classic gameplay of a retro RPG.

Prior Work vs. New Development

This project is a hybrid of new ideas and technical foundations I've built in my previous labs and projects:

- **Tilemap Logic:** I'm building on my experience using 2D array structures for movement. I've already experimented with grid systems in p5.js, and I'm scaling that up for this world.
- **Collision Detection:** I'll be using **AABB (Axis-Aligned Bounding Box)** techniques. This is a carry-over from my interactive design labs, where we practiced keeping spheres from going through walls or "falling" off the map.

- **Animation Loops:** I'm refining the sprite-sheet handling I used in my previous project, "**First Light of the Moon.**" I want the character's movement—especially the way movement flows—to feel smoother and more professional than my earlier animation tests.
